THE SOLUTION

Tracking and paying, in the same place.

- A Soroban contract keeps the ledger and finds the fewest payments.
- Settle all: every debt, one signature, one atomic transaction.
- Money arrives in about 5 seconds, for a fraction of a cent.
- No crypto jargon: names, amounts and a “Pay” button.

👉 **Why it wins:** the payment is inside the app, not an IOU.

KEY FEATURES

Built for paying back, not just keeping score.

- ► Pay in euros: Stellar’s AMM converts; your friend gets the exact amount.
- ► Join by link or QR; only the invite’s hash is stored on-chain.
- ► Equal or custom splits; the ledger always sums to zero.
- ► Overpay protection: pay only what you owe, to who is owed.

👉 **Also:** English, Spanish, Portuguese · light and dark mode · installable PWA.

PITCH STEP 02 / 04

PMF

Splitting is easy to track and annoying to pay.

- Splitwise and Tricount keep the score; the money moves elsewhere, or never.
- Small debts linger, and asking a friend for 12 € feels awkward.
- Across borders, slow transfers and fees can be bigger than the debt.
- International students and travel groups feel it most.

👉 **Who cares:** anyone who has waited weeks for a friend abroad to pay them back.

PITCH STEP 02 / 04

GO-TO-MARKET

Start where paying back hurts most.

- Entry wedge: international students and Erasmus flatmates.
- Next: travel groups and digital nomads; then shared flats.
- Revenue: small fee on cross-currency settlements; premium groups.
- Roadmap: EURC/USDC, cash-out via anchors (SEP-24), mainnet, mobile.

👉 **Built so far:** groups, splits, settle all, invites, pay in euros, passkeys.

PITCH STEP 03 / 04

WHY STELLAR

Paying back 3 € finally makes sense.

- ~5 s finality and fees far below a cent per settlement.
- Native path payments + AMM: pay in one currency, receive another.
- Stellar Asset Contracts: Soroban moves real XLM, no wrapping.
- Anchors (next): cash out to a bank account in your own currency.

👉 **Only on Stellar:** payments, FX and smart contracts in one network.

TECHNICAL WORKFLOW

Web app → wallet → Soroban contract → Stellar payment.

- ▸ React PWA (ES · EN · PT) on Vercel; Freighter or a Nido passkey signs.
- ▸ Contract: groups, custom splits, fewest payments, settle_all, invites.
- ▸ XLM moves via its Asset Contract; euros via a path payment on the AMM.
- ▸ Live on testnet, contract tests passing, receipts on stellar.expert.

👉 **Feasible today:** everything in the demo runs on Stellar testnet.

PITCH STEP 03 / 04

PASSKEYS

No extension. No seed phrase.

- Nido by The Aha Company (HackMeridian partner): wallet with Touch ID.
- The wallet is a Soroban smart account (C… address).
- Authorize LumenSplit once: 7 days, daily XLM cap enforced on-chain.
- Then friends join and pay without signing every time.

👉 **Why it matters:** onboarding is the biggest barrier to paying with crypto.

THE TEAM

Three builders, 28 hours, one working product.

- Manuel Villegas · Soroban contract, deployment and integration.
- Gregorio Torres · Frontend: the React app and its UX.
- Alejandro Teva · Design, brand, pitch and demo video.
