

# LumenSplit

## Split bills with friends. Settle up in seconds, from anywhere.

HackMeridian Lisbon 2026 · Genesis track · Built on Stellar

THE PROBLEM

# Tracking is easy. Paying is not.

### Apps only keep the score

Splitwise and Tricount say who owes what. The money moves somewhere else, or never.

### Small debts linger

Someone always ends up out of pocket, and asking a friend for 12 € feels awkward.

### Borders make it worse

Paying back a friend abroad means slow transfers, FX spreads and fees bigger than the debt.

THE SOLUTION

# Tracking and paying, in the same place

**1** **Add the group's expenses**

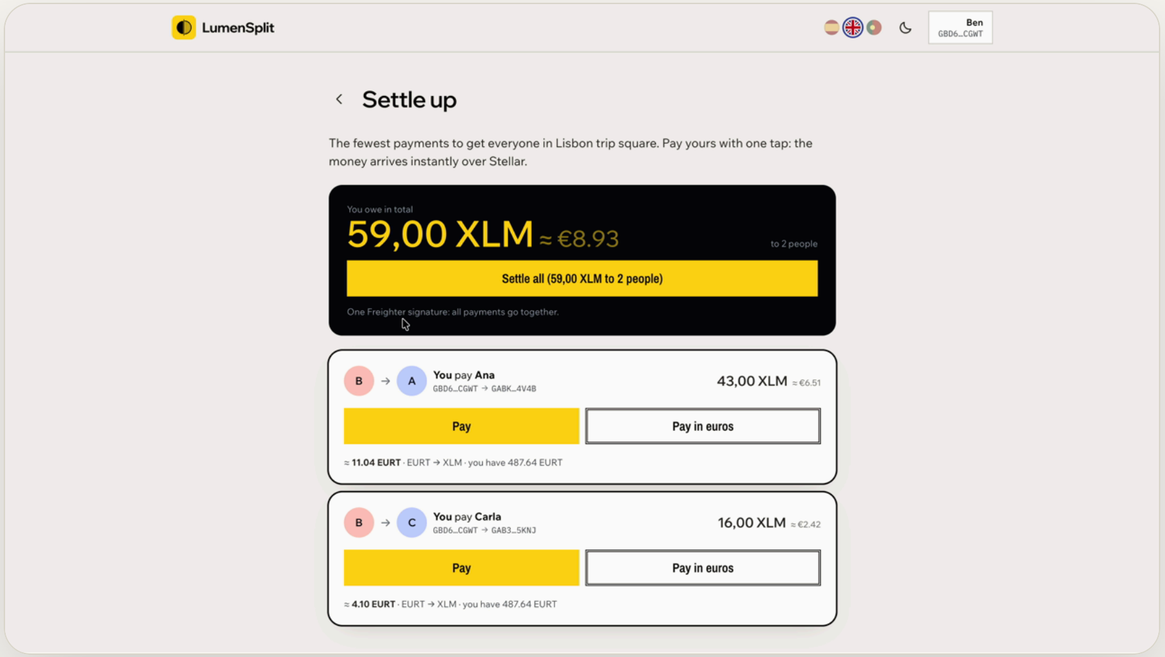

Split equally or type each share.

**2** **The contract finds the fewest payments**

Five crossed debts become two payments.

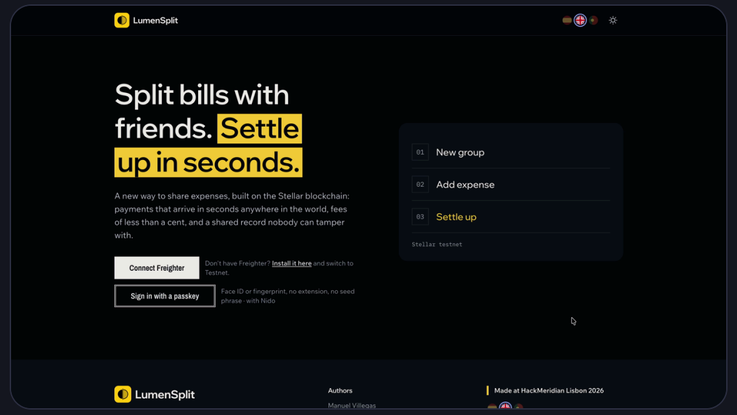

**3** **Tap Pay, settled in ~5 seconds**

Real money on Stellar, for a fraction of a cent.

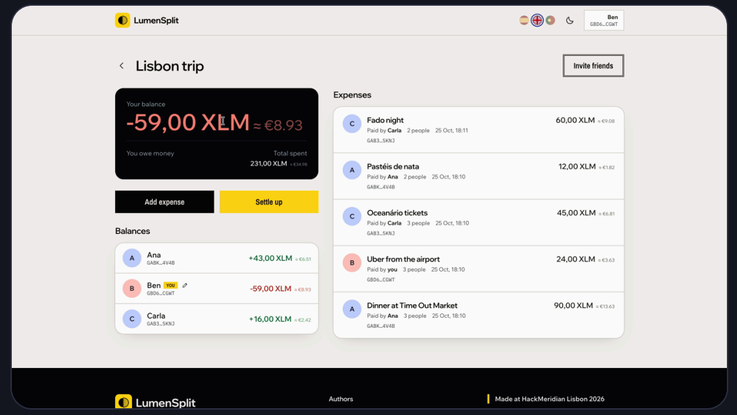

THE PRODUCT

# A normal bill-splitting app. That actually pays.

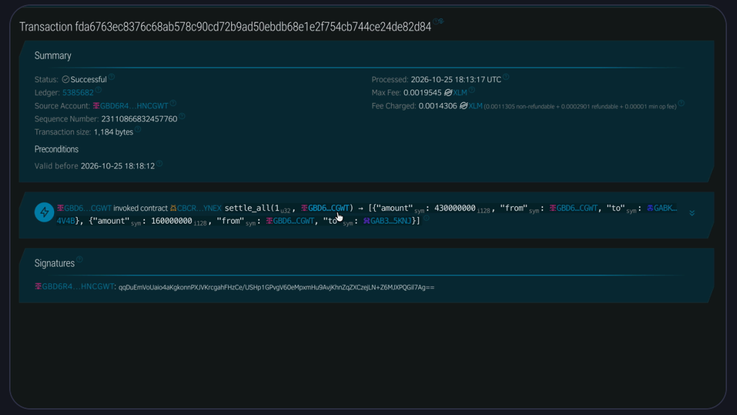

## Sign in

Freighter, or a passkey. Light and dark mode.

## See the balances

Every expense lives in a Soroban contract.

## Settle on-chain

Two payments, one transaction, public receipt.

WHAT'S DIFFERENT

# Built for paying back, not just keeping score

### On-chain simplification

The contract computes the fewest payments, so everyone sees the same answer.

### Settle all, atomically

Every debt you have, one signature, one transaction. All of it or nothing.

### Pay in euros

Stellar's built-in exchange converts on the fly. Your friend gets the exact amount.

### Join by link or QR

No copying wallet addresses. Only the invite's hash is stored on-chain.

### Equal or custom splits

"I had the good bottle": type each share. The ledger always sums to zero.

### Overpay protection

You can only pay what you owe, to someone who is actually owed.

WHY STELLAR

# Paying back 3 € finally makes sense

**~5 s**
from tap to settled

**< 1¢**
in network fees per settlement

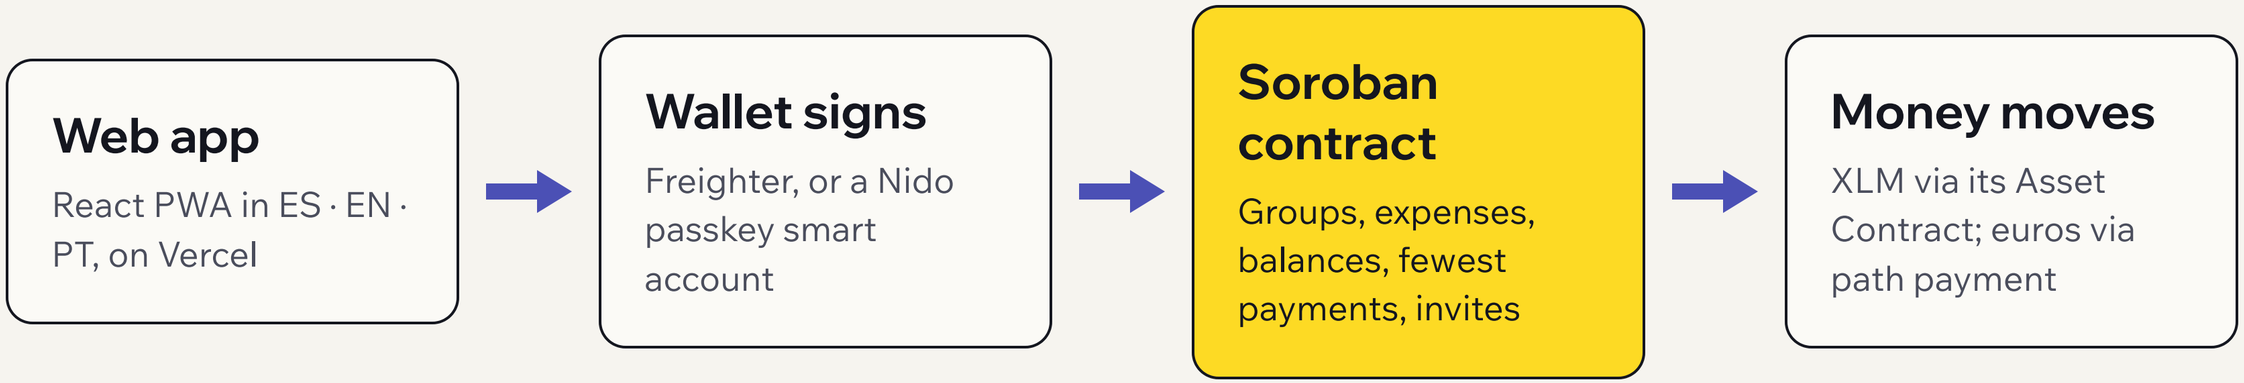

**€ → XLM**
native path payments and AMM

**1 tx**
to settle every debt at once

Soroban keeps the shared ledger · Stellar Asset Contracts move real XLM with transfer, no wrapping · Anchors are next, for cashing out to a bank.

HOW IT WORKS

# One contract holds the group’s truth

`create_group · add_expense · add_expense_custom`

`suggest_settlements · settle · settle_all`

`create_invite · join_group`

PASSKEY WALLETS · WITH NIDO BY THE AHA COMPANY

# No extension. No seed phrase.

## Touch ID creates the wallet

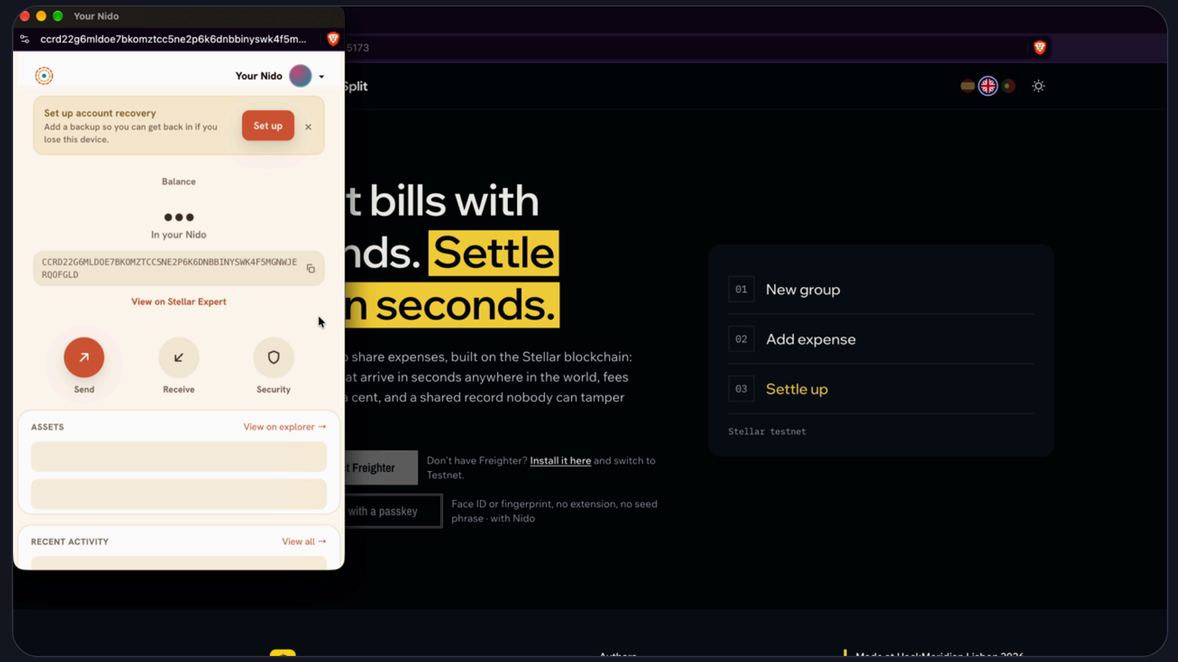

A smart account (C…) through Nido, a HackMeridian partner.

## Authorize LumenSplit once

7 days, with a daily XLM limit the account enforces on-chain.

## Then it just works

Friends join and pay without installing anything.

WHO IT’S FOR

# Start where paying back hurts most

ENTRY WEDGE

## International students

Erasmus groups and flatmates from different countries, paying each other back across borders.

NEXT

## Travel groups and nomads

Trips where everyone pays something, in different currencies.

THEN

## Shared flats

Rent, bills and groceries that repeat every month.

BUSINESS MODEL

A small fee on cross-currency settlements · premium groups with recurring bills and receipt export.

ROADMAP

# From testnet to your bank account

## Done at HackMeridian

- Groups, expenses, custom splits
- Real payments, settle all in one tx
- Invites by link or QR
- Pay in euros (path payments)
- Passkey wallets with Nido

## Next

- Real stablecoins: EURC, USDC
- “Settle all in euros” in one tap
- Recurring expenses, percentage splits

## Later

- Cash out to a bank through anchors (SEP-24)
- Mainnet
- Mobile app

THE TEAM

# Three builders, 28 hours, one working product

MV

## Manuel Villegas

Soroban contract, deployment and integration

GT

## Gregorio Torres

Frontend

AT

## Alejandro Teva

Design, pitch and demo video

# Split bills.
# Settle in seconds.
